

Energy Efficiency Policy: Environmentally Conscious Practices

At Fulli's, we are committed to environmental stewardship and sustainable practices. Our energy efficiency policy incorporates the following environmentally conscious initiatives:

1. Eco-Friendly Lighting System

We have recently transitioned to an eco lighting system equipped with smart sensors. These sensors ensure that lights are activated only when necessary and promptly turn off when no longer needed. By implementing this energy-efficient solution, we achieve the following:

- **Reduced Electricity Consumption:** Our smart lighting system significantly lowers energy usage, contributing to cost savings and minimizing our carbon footprint.
- **Environmental Preservation:** By minimizing unnecessary lighting, we actively participate in preserving natural resources and reducing greenhouse gas emissions.

2. Warehouse Heating Optimization

In addition to our lighting upgrades, we've optimized our warehouse heating system. Here's how:

- **Strategic Heating Control:** When doors leading to the outside are open, the heating system automatically switches off. This measure not only conserves energy but also aligns with our commitment to safeguarding the planet.
- **Efficient Energy Use:** Our heating system operates only when needed, ensuring efficient energy utilization and minimizing waste.

Our Pledge

At Fulli's, we recognize that every small step counts. By adopting these sustainable practices, we actively contribute to protecting the environment. Together, we can make a significant impact in preserving our beautiful planet for future generations.
